

RGB Color Box

formerly known as HTML Color Picker

This little HTML-utility for Windows 95 is used to generate BODY-tags for your HTML-documents. You have then the possibility for saving your colorselections in a colorscheme. RCB also supports tiled background images (note! only bmp's). Remember that this program is *Freeware* what means you have unlimited right to use it.

Newest release: RGB Color Box v1.4 August 13, 1996. [Download free copy now.](#)

Here follows a on-line guide to get started with RGB Color Box (even though Quick Help! has been added in version 1.2)

To the right you see the main screen where all the action takes place. In the Tag Picker-window, you choose what tag you want to modify - options are : background, text, new link, visited link or active link. When you have chosen the tag, you can slide the bars in the Color Picker-window to hit the color you want. After you have made your mind you can click on the Generate Body Tag-button in the Body Tag-window. If you want to select a color from your windows default colors, you first choose which tag you want to give the color, and then you press Ctrl-P or select Tools, Windows Color Picker. If you want to have a background in you BODY-tag, then select the menu Tools, and then select Show Backgrounds?. Then you once again select the menu Tools and this time select the menuitem Load Background (or press Ctrl-L). A dialogbox appears where you can choose a bmp-file you want to use as a background. When you selects OK in the dialogbox the background is shown in the Sample Homepage-window.

When you want to use your tag you click on the Generate Body Tag-button (if visible). Then you can either press Ctrl-T to copy the whole bodytag or you can select all the text in the Body Tag-window and press Ctrl-C. Finally you can modify the text in the Body Tag-window (ex. delete the path for a picture), and the press Ctrl-T.

If you have made a great scheme you want to reuse another time, then select the menu Schemes, and then Save A Scheme - or simply press Ctrl-S. Another dialogbox will appears, where you have to give your color file a name. Remember that the extension hep is added to the file if you don't write it yourself. When you want to open a previously saved scheme you press Ctrl-O or select Schemes, Load A Scheme.

Thanks to The Color Manipulation Device 2.0 from Flux for the inspiration.

If you find any bugs in the program or if you have any ideas for further improvements then don't hesitate to [contact me](#) or snailmail on:
